

**Scott M. Volmar**, *InterComputer Corporation*

Scott Volmar is the founder, President, and CEO of InterComputer Corporation. Scott attended the University of Utah and California State University, Fullerton. His prior experience as CFO of a company engaged in contracting and multi-party transactions triggered the thinking that resulted in InterComputer's mission to revolutionize and secure internet communications with a variety of applications, including secure, insured real-time payments. A lifelong electronics buff, Scott holds the highest amateur radio license and has built his own personal computers from the early days of the pc era. Scott is one of the primary architects of the IC IOS or InterComputer InterOperating System, providing absolute security, privacy, and trust for governed interoperability between organizations and within them. He has managed a team of the highest professionals in their disciplines in the successful development, demonstration, and commercialization of the first fully insured real-time electronic transaction system and granted patents along the way. After more than a year of review and vetting, Lloyds of London underwrote InterComputer's IC IOS against all forms of cybercrime for all customers using it from end-to-end, and for the face value of fiat currency. InterComputer Corporation retains the distinction only company and software uniquely underwritten to date.
